

Bird Removal, Exclusion and Deterrents

Starlings, Pigeons and Seagulls are our main problem birds when dealing with residential buildings. We offer a wide variety of proven services depending on the situation(s) once we inspect the property.

Removal of Starlings nests inside vents, relocating pigeons and seagulls from building ledges and roof tops is achievable if completed properly and understanding which products will work in each situation.

In recent years we continue to receive more and more calls inquiring about ways to deter Canadian Geese from feeding and defecating on residential properties. There has been very limited success with turf applied repellants and noise makers for these persistent birds.

The most long term cost effective solution we have found for clients, is the purchase of our full life size coyote mount and captured goose. The real life decoy in conjunction with regular re-positioning on the problem property has produced significant success.
