

Waterfront Spider and Insect Service Programs

Cottages and Homes in close proximity to bodies of water experience significantly more insect and spider activity in May, June and July than rural agricultural area residences. Due to the variety of different fly hatches on in-land lakes. Spiders have an abundant food source, which in turn produce abundant, multiple spider egg hatches throughout our warm weather seasons.

Recommended Service Options to consider

- (A) Double Treatment: (most popular) Two Exterior Treatments spaced out between 1st of May to end of August. This program has been extremely beneficial for our clients ensuring effective Spider Control for the entire warm weather season.
- (B) Single Treatment: We have a number of clients that have a form of tolerance to spider activity around their property and only request one treatment each year. We complete Services for these clients in the month of June. These clients monitor their activity for the balance of the Summer, and if needed, they can request a second treatment later in the summer at the same price as their June Treatment.
- (C) Monthly Treatment: A small percentage of our clients have Zero Tolerance for any spider activity. For these clients we complete one exterior treatment each month from May through to September to ensure there is no spider populations directly around the residence perimeter.
